                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the POlyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and Niver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease. The protein produced from this sequence contains the alpha-helix0-7 variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9

The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enizymes. These proteins are both wesential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-7 variant.

```
The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100

These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the Polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease: Inhibitor complexes. The protein produced from this

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4 fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C

                                                                                                                                                                                                                                            The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the POlyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver fallure and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant.

The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is the coding sequence for a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as
Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C

The present invention relates to a nucleic acid construct encoding a chimeric Hepatitis C virus (HCV)-pestivirus genome. The construct comprises a pestivirus genome where a Npro pestivirus protease gene is replaced with a genome encoding a functional HCV NS3 protease. Furthermore, each junction site recognised by the Npro protease is replaced with a junction site recognised by the HCV NS3 protease. The construct is useful for screening compounds that inhibit HCV in vivo by inhibiting HCV protease, where screening may be in cell culture or in an animal model. The present sequence is a chimeric clone of BVDV (bovine viral diarrheavirus)/HCV NS3-wt, which was used to illustrate the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         532
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     592

                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A perinde, a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3A protease domain. The present NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPASS activity of NS3. The covalent COVAINTS COMPLEXES are more soluble, stable and active than the noncovalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     41

NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPASE activity of NS3. The covalent covalent covalent complexes are more soluble, stable and active than the non-

The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NNR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent Covalent protease scivity stands complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           81
                                                                                                                                                                                                                                                                                                                                                                                                                                             NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A Peptide, a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GlySerValValIleValGlyArgIleAsnLeuSerGlyAsp-----ThrAlaTyr

                hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GlyServalValileValGlyArgileAsnLeuSerGlyAsp-----ThrAlaTyr

The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-NS3 complex. Comprising a central hydrophobic domain of native HCV NS3 earlie protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPRSE activity of NS3. The covalent covalent protease-peptide complexes previously available.
HCV; hepatitis C virus; single chain recombinant complex; linker;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

// clone=lib="Cc. reinhardii CC-1690, Stress condition I,
normalized, Lambda Zap II"
// note="vector: pBluescript II SK-; Site_I: ECORI; Site_2:
XhoI; This library, constructed by John Davies and Jeffrey
MCDermott, combines cDNAs from CC-1690 cells grown to
mid-log phase in TAP-N (30 min, 1hr, 4hr), TAP-S (30 min,
1hr, 4hr), TAP-P (4hr, 12hr, 24hr), No3 to NH4 (30min, 1hr,
4hr) and NH4 to NO3 (30min, 1hr, 4hr). PolyA mRNA was
purified from each sample, pooled and cDNA synthesized.
The CDNA was directionally cloned into lambda Zap II
(Stratagene) in the ECORI (5') and XhoRI (3') sites.
pBluescript II SK- plasmids were excised from the lambda
ZAP clones by superinfection with ExAssist (Stratagene)
phage: The library was normalized using method 4 described
in Bonaldo et al (1996) Genome Research 6: 791-806."

```
The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the mutaviral treatments of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. This sequence contains the alpha-helixo-7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  121 LVTRHADVIPVRRRGDSRGSLLSPRPISYLRGSSGGPLLCPAGHAVGIFRAAVSTRGVAK 180
 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C

The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirthosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and proteins view of the protease and

The present sequence is a mutated version of a fusion protein created using the Hepatitis C viris (HCV) NG3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of the two proteins should be effective as antiviral treatments of the two proteins. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NG3 mutants and NG3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease. Inhibitor complexes. This sequence contains the alpha-helix0-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis {\cal C}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TSINGVLWTVYHGAGTRTIASPKGPVTQMYTNVDKDLVGWQAPQGSRSLTPCTCGSSDLY

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                           The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the try genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and

                                                                                                                                                                                                                                                                                                ö
                                                                                                       The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HVV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the mutuvial treatments of the two proteins should be effective as antiviral treatments of the two proteins should be effective as antiviral treatments of the two proteins should be effective as chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease: Inhibitor complexes. This sequence contains the alpha-helix0-1

```
The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A well as enabling structural studies of the protease and proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease: Inhibitor complexes. This sequence contains the alpha-helix0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease. This sequence contains the alpha-helix0-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TSINGVLWTVYHGAGTRT1ASPKGPVTQMYTNVDKDLVGWQAPQGSRSLTPCTCGSSDLY 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    28
                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replication of the virus, acting to cleave its replicative proteins from the Polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutents and NS3-MCS4 fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor
                                                                                                                                                                Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 MKKKGSVVIVGRINLSGDTAYAQQTRGEQGTQKTSHTGRDKNQVEGEVQIVSTATQTFLA

                                                                                                                                                                                                                                NSAA-NS3 complex comprising a central hydrophobic domain of native HCV hydrophobic domain of native HCV hydrophobic domain of native HCV NSAA peptide is tethered by the linker to the amino terminus of the HCV NSAA peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NSAA-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NSAA-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.

                                                                                                                                                                                                                              The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61

                                                                                                                                                                                                                                                                                                                                                                                                                       q
                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                                                                            142 VTRHADVIPVRRRGDSRGSLLSPRPVSYLKGSSGGPLLCPSGHAVGIFRAAVCTRGVAKA 201
                                                                                        The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-PBF10de, a linker, and an HCV NS3 Serine procease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                   121

```
NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-NS3 complex and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by MRX spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the Arpase activity of NS3 The covalent NS4A-NS3 complexes are more soluble, stable and active than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SINGVLWTVYHGAGTRTIASPKGPVTQMYTNVDKDLVGWQAPQGSRSLTPCTCGSSDLYL 121

                                                                                                                                                                                                                                                                                                                                                                                     NS4A MS3 complex comprising a central hydrophobic domain of native HCV MS4A peptide. a linker, and an HCV NS3 berine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the Arpase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                      61

                                                                                                                          The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide, a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               83
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   22 GSVVIVGRIILSGSGSITAYSQQTRGLIGCKITSLIGRDKNQVEGEVQVVSTATOSFLAT

The present invention describes a covalent hepatitis C virus (HCV) NSAA NS3 complex comprising a central hydrophobic domain of native HCV NS4A PS3 complex comprising a central hydrophobic domain of native HCV NS3 erine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethored by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                       New hepatitis C virus covalent complexes
                                                                                Claim 6; Page 80-81; 211pp; English.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               genome polyprotein - hepatitis C virus (strain JT)
N.Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98) (nonstructu protein NS4s: nonstructural protein NS4s: nonstructural protein NS5
C; Species: hepatitis C virus
C; Species: hepatitis C virus
C; Accession: A45573
